Abstract

In this work, we apply the Averaging Method to obtain the theoretical results. The Nonlinear Saturation Controller (NSC) is proposed to decrease the vacillations of the spring pendulum. We investigate the stability of the system near the resonance condition by applying the frequency response equations. Numerically, the effects of diversified controller’s parameters on the basic system behaviour are studied. The emulation results are attained by utilising Matlab and Maple programs.

Keywords: Averaging method; stability; NSC control; vibration control.

1 Introduction

One of the most important engineering problems is vibration control. Many methods have been developed for suppression the vibration using active or passive controllers. It is worth to be mentioned that several control techniques are used to regulate the reaction of a system such like: passive control, semi active
control, active control, and hybrid control. In the work [1], Kamel et al presented the vacillation and stability of the nonlinear spring pendulum which was depicting the roll motion of a ship. They studied the influences of the linear controller on the fundamental system subject to multi parametric stimulation. Zhou and Chen [2] used two procedures of ship example under sinusoidal harmonic stimulation to investigate the response and constancy of the system. They got the equation of bifurcation response close to the collection resonance case in the existence of internal resonance of the studied system.

Lee et al. [3-5] studied the demeanor of the Spring Pendulum system subordinated to single-harmonic-excitation force. The concluded results elucidated that the system had an extremely complicated attitude which include Hopf bifurcations and jump phenomena. Not that only, they also discovered that the approximation with the 2nd - order gave more perfect harmonisation with the fundamental system than the 1st – order did. Song et al. [6] scrutinised the oscillation reaction of the spring mass damper system with an agitated parametrically pendulum suspended to the mass by using the harmonic balance method. Furthermore, they illustrated the unstable motion zone of the system which gotten from the 3rd - order approximation to become completely coordinated with which acquired from numeral computation. Eissa et al [7–10] and Sayed [11] applied diversified controllers on the simple and the spring pendulums which showing the sway motion of the ship then; they studied the effects of them. They subjected the two procedures under single-harmonic- stimulation force then they studied the action of the transversal and linear toned absorbed controllers on the existing vibrations. Structural damping treatment is one of the exemplary passive vibrations control near that had been utilised in the practical structural engineering, but active damping had also enticed the interesting of a considerable number of investigators [12–14].

The researchers in the work [15], EL-Sayed and Bauomy subjected a nonlinear dynamic system to multi-parametric-stimulation forces then they investigated the effectiveness of time- delay controller on the existent vibrations. And they applied the averaging method to drive the system’s frequency response equations. Hamed and Amer [16] introduced a research for (NSC) controller which had been utilised to repress the vibrated amplitude of a structural dynamic model assuming non- linear composite beam. They had a great result by utilising the saturation for frustrating the vacillation of their non-linear system. Warminski J. et al. [17] introduced experimental and numerical surveys of four kinds of controllers utilised to non- linear beam models. Validation of distinct control designs is estimated utilising numeral simulations in Matlab-Simulink program software. The mathematical results for non- linear dynamic system with NSC are acquired utilising multiple scale method. The numerical and analytical interpretation for NSC submits the effect of most substantial parameters on the efficiency of the control of a non- linear established paradigm for an extensive domain of frequency of stimulation and peak scale of amplitude. The consequences for a solo beam system display which positive position feedback (PPF) and (NSC) controllers are the most influential for supposed provisions of the established paradigm.

Saeed et al. [18] used saturation-based controller with time delay in active extinction of nonlinear beam vibrations. They found that the time delays append to the response neoteric control keys through contraction the bandwidth of the controller’s frequency. They mathematical solutions were in a great agreement with the numerical ones. Saeed and El-Gohary [19] modified the model of saturation controllers which added to the system through quadratic nonlinearity coupling. They investigated the leverage of time delays on the system’s stability and controller’s behavior. Ashour and Nayfeh [20] had used a non- linear controller as a vacillation suppressor established on saturation incident influential for depression of torsional and flexural oscillations of the plate. The assessment of hesitancy of stimulation had been appended to the system to magnify the leverage of the saturation control.

Our main aim of the present paper is to apply control to diminish the vacillation of the system. This controller is NSC control. Averaging technique is used to get the mathematical analysis. Some testaments concerning the diversified parameters of the spring pendulum are notified and the influences of the NSC controllers on the system's demeanor will be studied numerically.
2 Mathematical Model

The differential equations of motion characterising the oscillations of the non-linear spring pendulum with NSC controllers could be expressed as the next form:

\[
\ddot{x} + 2\varepsilon c \dot{x} + \omega_1^2 x + \alpha x^2 + \varepsilon\alpha \dot{x}^2 - (1 + x)\dot{\phi}^2 + \omega_2^2 (1 - \cos \phi) = \varepsilon^2 f_1 \cos(\Omega t) + \varepsilon y_1 u^1
\]  
(1)

\[
(1 + x)^2 \ddot{\phi} + 2\varepsilon c \dot{\phi} + 2(1 + x)\dot{x}\dot{\phi} + \omega_2^2 (1 + x)\sin \phi = \varepsilon^2 f_2 \cos(\Omega t) + \varepsilon y_2 u^2
\]  
(2)

\[
\ddot{u} + 2\varepsilon \mu \dot{u} + \omega_1^2 u = \varepsilon \lambda_1 u \phi
\]  
(3)

\[
\ddot{\nu} + 2\varepsilon \mu \dot{\nu} + \omega_2^2 \nu = \varepsilon \lambda_2 u \varphi
\]  
(4)
Where \( x \) and \( \varphi \) are the longitudinal and angular response of the spring pendulum respectively. \( u \) and \( v \) known as the response of the absorbers. \( c_j, \mu_j \ (j=1,2) \) are the spring pendulum modes’ damping coefficients and the NSC controllers, respectively. \( \omega_1, \omega_2, \omega_3 \) and \( \omega_4 \) are the spring pendulum modes’ natural frequencies of and NSC controllers, respectively. \( \alpha_1 \) and \( \alpha_2 \) are the non-linear parameters \( f_j \) is the external forcing amplitudes of the fundamental system \( \Omega_j \) is the excitation frequencies of the fundamental system \( \gamma_1, \gamma_2 \) are the control signal gains and \( \lambda_1, \lambda_2 \) are the feedback signal gains.

3 Mathematical Analysis (Averaging Method)

Applying the averaging method, the solutions for equations (1-4) from the first-order approximate are considering as:

\[
\begin{align*}
    x &= a_1 \cos(\omega_1 t + \psi_1) \\
    \varphi &= a_2 \cos(\omega_2 t + \psi_2) \\
    u &= a_3 \cos(\omega_3 t + \psi_3) \\
    v &= a_4 \cos(\omega_4 t + \psi_4)
\end{align*}
\]

Where \( a_n, \psi_n (n=1,2,3,4) \) exist as constants. Differentiate equations (5a) - (5d) we get:

\[
\begin{align*}
    \dot{x} &= -a_1 \omega_1 \sin(\omega_1 t + \psi_1) \\
    \dot{\varphi} &= -a_2 \omega_2 \sin(\omega_2 t + \psi_2) \\
    \dot{u} &= -a_3 \omega_3 \sin(\omega_3 t + \psi_3) \\
    \dot{v} &= -a_4 \omega_4 \sin(\omega_4 t + \psi_4)
\end{align*}
\]

For \( \epsilon \neq 0 \), relatively small, claim \( a_n, \psi_n (n=1,2,3,4) \) are dependent variables on time \( t \) in equations (1) - (4). Differentiating equations (5a) - (5d) once with respect to time \( t \) submits

\[
\begin{align*}
    \dot{x} &= \dot{a}_1 \cos(\omega_1 t + \psi_1) - a_1 \omega_1 \sin(\omega_1 t + \psi_1) - a_1 \psi_1 \sin(\omega_1 t + \psi_1) \\
    \dot{\varphi} &= \dot{a}_2 \cos(\omega_2 t + \psi_2) - a_2 \omega_2 \sin(\omega_2 t + \psi_2) - a_2 \psi_2 \sin(\omega_2 t + \psi_2) \\
    \dot{u} &= \dot{a}_3 \cos(\omega_3 t + \psi_3) - a_3 \omega_3 \sin(\omega_3 t + \psi_3) - a_3 \psi_3 \sin(\omega_3 t + \psi_3) \\
    \dot{v} &= \dot{a}_4 \cos(\omega_4 t + \psi_4) - a_4 \omega_4 \sin(\omega_4 t + \psi_4) - a_4 \psi_4 \sin(\omega_4 t + \psi_4)
\end{align*}
\]
Comparing equations (6a) - (6d) and equations (7a) - (7d) we realise that:

\[
\dot{a}_1 \cos(\omega t + \psi_1) - a_1 \dot{\psi}_1 \sin(\omega t + \psi_1) = 0
\]
\[
\dot{a}_2 \cos(\omega t + \psi_2) - a_2 \dot{\psi}_2 \sin(\omega t + \psi_2) = 0
\]
\[
\dot{a}_3 \cos(\omega t + \psi_3) - a_3 \dot{\psi}_3 \sin(\omega t + \psi_3) = 0
\]
\[
\dot{a}_4 \cos(\omega t + \psi_4) - a_4 \dot{\psi}_4 \sin(\omega t + \psi_4) = 0
\]

Differentiating equations (5a) - (5d) once respect to time \( t \) we find:

\[
\ddot{x} = -\dot{a}_1 \omega \sin(\omega t + \psi_1) - a_1 \ddot{\psi}_1 \cos(\omega t + \psi_1) - a_1 \dot{\psi}_1 \cos(\omega t + \psi_1) + a_1 \omega \dot{\psi}_1 \cos(\omega t + \psi_1)
\]  
(8a)

\[
\ddot{\varphi} = -\dot{a}_2 \omega \sin(\omega t + \psi_2) - a_2 \ddot{\psi}_2 \cos(\omega t + \psi_2) - a_2 \dot{\psi}_2 \cos(\omega t + \psi_2) + a_2 \omega \dot{\psi}_2 \cos(\omega t + \psi_2)
\]  
(8b)

\[
\ddot{u} = -\dot{a}_3 \omega \sin(\omega t + \psi_3) - a_3 \ddot{\psi}_3 \cos(\omega t + \psi_3) - a_3 \dot{\psi}_3 \cos(\omega t + \psi_3) + a_3 \omega \dot{\psi}_3 \cos(\omega t + \psi_3)
\]  
(8c)

\[
\ddot{v} = -\dot{a}_4 \omega \sin(\omega t + \psi_4) - a_4 \ddot{\psi}_4 \cos(\omega t + \psi_4) - a_4 \dot{\psi}_4 \cos(\omega t + \psi_4) + a_4 \omega \dot{\psi}_4 \cos(\omega t + \psi_4)
\]  
(8d)

Substituting \( x, \dot{x}, \ddot{x}, \varphi, \dot{\varphi}, \ddot{\varphi}, u, \dot{u}, \ddot{u}, v, \dot{v} \) and \( \ddot{v} \) from equations (5a) - (8d) into equations (1) - (4) and taking into account that \( \cos \varphi = 1 - \frac{\varphi^2}{2!}, \sin \varphi = \varphi - \frac{\varphi^3}{3!} \) we obtain the following:

\[
-\dot{a}_1 \omega \sin(\omega t + \psi_1) - a_1 \ddot{\psi}_1 \cos(\omega t + \psi_1) - a_1 \dot{\psi}_1 \cos(\omega t + \psi_1) + a_1 \omega \dot{\psi}_1 \cos(\omega t + \psi_1) - 2\varepsilon \zeta a_1 \omega \sin(\omega t + \psi_1)
\]
\[
+ a_1 \omega \ddot{\psi}_1 \cos(\omega t + \psi_1) + a_1 \omega \dot{\psi}_1 \cos(\omega t + \psi_1) + \varepsilon \alpha a_1 \dot{\psi}_1 \cos(\omega t + \psi_1) - (1 + a_1 \cos(\omega t + \psi_1)) a_1 \omega \sin^2(\omega t + \psi_1) + \omega_1^2 \left(1 - \frac{\varphi^2}{2!}\right)
\]
\[
= \varepsilon x f_1 \cos(\Omega t) + \varepsilon \gamma a_1 \ddot{\psi}_1 \cos(\omega t + \psi_1)
\]  
(9a)

\[
(1 + a_1 \cos(\omega t + \psi_1)) \left(-\dot{a}_2 \omega \sin(\omega t + \psi_2) - a_2 \ddot{\psi}_2 \cos(\omega t + \psi_2) - a_2 \dot{\psi}_2 \cos(\omega t + \psi_2) + a_2 \omega \ddot{\psi}_2 \cos(\omega t + \psi_2) - 2\varepsilon \zeta a_2 \omega \sin(\omega t + \psi_2)
\]
\[
+ a_2 \omega \ddot{\psi}_2 \cos(\omega t + \psi_2) + \varepsilon \alpha a_2 \dot{\psi}_2 \cos(\omega t + \psi_2) - (1 + a_1 \cos(\omega t + \psi_1)) a_2 \omega \sin(\omega t + \psi_1) + (1 + a_1 \cos(\omega t + \psi_1)) (a_2 \omega \sin(\omega t + \psi_1))(a_2 \omega \sin(\omega t + \psi_2))
\]
\[
+ \omega_2^2 (1 + a_1 \cos(\omega t + \psi_1)) (1 - \frac{\varphi^2}{3!})
\]
\[
= \varepsilon^2 f_2 \cos(\Omega t) + \varepsilon \gamma_2 a_1 \ddot{\psi}_1 \cos(\omega t + \psi_4)
\]  
(9b)

\[
-\dot{a}_3 \omega \sin(\omega t + \psi_3) - a_3 \ddot{\psi}_3 \cos(\omega t + \psi_3) - 2\varepsilon \mu a_3 \omega \sin(\omega t + \psi_3)
\]
\[
= \varepsilon^2 a_1 a_3 \cos(\omega t + \psi_3) \cos(\omega t + \psi_1)
\]  
(9c)

\[
-\dot{a}_4 \omega \sin(\omega t + \psi_4) - a_4 \ddot{\psi}_4 \cos(\omega t + \psi_4) - 2\varepsilon \mu a_4 \omega \sin(\omega t + \psi_4)
\]
\[
= \varepsilon^2 a_1 a_4 \cos(\omega t + \psi_4) \cos(\omega t + \psi_2)
\]  
(9d)
Using equations (7a) – (7d) we get:

\[
\dot{a}_i = -\epsilon_c \alpha_i a_i \cos(2\omega t + 2\psi_i) + \frac{\alpha_a \alpha_i}{2\omega_i} \sin(\omega t + \psi_i) + \frac{\alpha_a \alpha_i^2}{4\omega_i} \sin(3\omega t + 3\psi_i) \\
+ \frac{\alpha_a \alpha_i}{4\omega_i} \sin(\omega t + \psi_i) + \frac{\epsilon \alpha \alpha_a}{4\omega_i} \sin(2\omega t + 2\psi_i) + \frac{\epsilon \alpha \alpha_a}{8\omega_i} \cos(4\omega t + 4\psi_i) \\
- \frac{\alpha_a \omega_i}{2\omega_i} \sin(\omega t + \psi_i) + \frac{\alpha_a \omega_i^2}{4\omega_i} \sin((\omega + 2\omega_i)t + (\psi_i + 2\psi_i)) + \frac{\alpha_a \omega_i^2}{4\omega_i} \sin((\omega - 2\omega_i)t + (\psi_i - 2\psi_i)) \\
- \frac{\epsilon \alpha \omega_i}{8\omega_i} \sin(2\omega t + 2\psi_i) + \frac{\epsilon \alpha \omega_i}{8\omega_i} \sin((2\omega + 2\omega_i)t + (2\psi_i + 2\psi_i)) \\
+ \frac{\alpha_a \omega_i}{8\omega_i} \sin((\omega + 2\omega_i)t + (\psi_i + 2\psi_i)) + \frac{\alpha_a \omega_i}{8\omega_i} \sin((\omega - 2\omega_i)t + (\psi_i - 2\psi_i)) \\
\] (10a)

\[
a_i \dot{\psi}_i = -\epsilon_c \alpha_i a_i \sin(2\omega t + 2\psi_i) + \frac{\alpha_a \alpha_i^2}{2\omega_i} \cos(\omega t + \psi_i) + \frac{\alpha_a \alpha_i^2}{4\omega_i} \cos(\omega t + \psi_i) \\
+ \frac{\alpha_a \alpha_i}{2\omega_i} \cos((3\omega t + 3\psi_i) + \frac{3\alpha \alpha_a}{8\omega_i} + \frac{\epsilon \alpha \alpha_a}{2\omega_i} \cos(2\omega t + 2\psi_i) + \frac{\epsilon \alpha \alpha_a}{8\omega_i} \cos(4\omega t + 4\psi_i) \\
- \frac{\alpha_a \omega_i}{2\omega_i} \cos(\omega t + \psi_i) + \frac{\alpha_a \omega_i^2}{4\omega_i} \cos((\omega - 2\omega_i)t + (\psi_i - 2\psi_i)) \\
+ \frac{\alpha_a \omega_i}{4\omega_i} \cos((\omega + 2\omega_i)t + (\psi_i + 2\psi_i)) - \frac{\alpha_a \omega_i}{4\omega_i} \cos(2\omega t + 2\psi_i) \\
- \frac{\alpha_a \omega_i}{4\omega_i} \cos(2\omega t + 2\psi_i) + \frac{\alpha_a \omega_i}{4\omega_i} \cos((2\omega_i - 2\omega_i)t + (2\psi_i - 2\psi_i)) \\
+ \frac{\alpha_a \omega_i}{4\omega_i} \cos((2\omega + 2\omega_i)t + (2\psi_i + 2\psi_i)) - \frac{\omega_i \alpha_i}{4\omega_i} \cos(\omega t + \psi_i) \\
- \frac{\epsilon \omega_i \alpha_i}{8\omega_i} \cos((2\omega - 2\omega_i)t + (2\psi_i - 2\psi_i)) + \frac{\epsilon \omega_i \alpha_i}{8\omega_i} \cos((2\omega + 2\omega_i)t + (2\psi_i + 2\psi_i)) \\
- \frac{\epsilon \omega_i \alpha_i}{8\omega_i} \cos((\omega - 2\omega_i)t + (\psi_i - 2\psi_i)) - \frac{\epsilon \omega_i \alpha_i}{8\omega_i} \cos((\omega + 2\omega_i)t + (\psi_i + 2\psi_i)) \\
+ \frac{\epsilon \omega_i \alpha_i}{4\omega_i} \cos((\omega - 2\omega_i)t + (\psi_i - 2\psi_i)) + \frac{\epsilon \omega_i \alpha_i}{4\omega_i} \cos((\omega + 2\omega_i)t + (\psi_i + 2\psi_i)) \\
\] (10b)
\[
\ddot{a}_2 = \frac{-a_1\omega^2}{2} \sin(2\omega t + 2\psi_2) - \epsilon c_2 a_2 + \epsilon c_2 a_2 \cos(2\omega t + 2\psi_2) + 2\epsilon c_2 a_2 \cos(\omega t + \psi_1) \\
- \epsilon c_2 a_2 \cos((\omega_t - 2\omega) t + (\psi_1 - 2\psi_2)) - \epsilon c_2 a_2 \cos((\omega_t + 2\omega) t + (\psi_1 + 2\psi_2)) \\
+ a_1 a_2 \omega \sin(\omega t + \psi_1) - \frac{a_1 a_2 \omega}{2} \sin((\omega_t + 2\omega) t + (\psi_1 + 2\psi_2)) \\
- \frac{a_1 a_2 \omega}{2} \sin((\omega_t - 2\omega) t + (\psi_1 - 2\psi_2)) - \frac{a_1 a_2 \omega}{2} \sin(2\omega t + 2\psi_1) \\
+ \frac{a_1 a_2 \omega}{4} \sin((\omega_t + 2\omega) t + (\psi_1 + 2\psi_2)) + \frac{a_1 a_2 \omega}{4} \sin((\omega_t - 2\omega) t + (\psi_1 - 2\psi_2)) \\
+ \frac{a_1 a_2 \omega}{2} \sin(2\omega t + 2\psi_2) - \frac{a_1 a_2 \omega}{24} \sin(2\omega t + 2\psi_2) - \frac{a_1 a_2 \omega}{48} \sin(4\omega t + 4\psi_2) \\
- \frac{a_1 a_2 \omega}{4} \sin((\omega_t + 2\omega) t + (\psi_1 + 2\psi_2)) + \frac{a_1 a_2 \omega}{4} \sin((\omega_t - 2\omega) t + (\psi_1 - 2\psi_2)) \]
\[
\begin{align*}
\alpha_2 \psi_2 &= -\frac{a_2 \omega}{2} - \frac{a_2 \omega}{2} \cos(2\omega_2 t + 2\psi_2) - \epsilon \omega \alpha_2 \sin(2\omega_2 t + 2\psi_2) \\
&+ a_1 \epsilon \omega \alpha_2 \sin((2\omega_2 + \omega_1) t + (2\psi_2 + \psi_1)) + a_1 \epsilon \omega \alpha_2 \sin((2\omega_2 - \omega_1) t + (2\psi_2 - \psi_1)) \\
&+ \frac{a_2 \omega}{2} \cos((\omega_1 - 2\omega_2) t + (\psi_1 - 2\psi_2)) - \frac{a_2 \omega}{2} \cos((\omega_1 + 2\omega_2) t + (\psi_1 + 2\psi_2)) \\
&- \frac{a_2 \omega}{4} \cos((2\omega_1 - 2\omega_2) t + (2\psi_1 - 2\psi_2)) - \frac{a_2 \omega}{4} \cos((2\omega_1 + 2\omega_2) t + (2\psi_1 + 2\psi_2)) \\
&+ \frac{\omega_1 a_2}{2} + \frac{\omega_1 a_2}{2} \cos(2\omega_2 t + 2\psi_2) - \frac{3\omega_1 a_2}{48} - \frac{\omega_1 a_2}{12} \cos(2\omega_2 t + 2\psi_2) - \frac{\omega_1 a_2}{48} \cos(4\omega_2 t + 4\psi_2) \\
&- \frac{a_2 \omega}{2} \cos(\omega_1 t + \psi_1) - \frac{a_2 \omega}{4} \cos((\omega_1 - 2\omega_2) t + (\psi_1 - 2\psi_2)) + \frac{2a_2 \omega}{24} \cos(\omega_1 t + \psi_1) \\
&+ \frac{a_2 \omega}{24} \cos((\omega_1 - 2\omega_2) t + (\psi_1 - 2\psi_2)) + \frac{a_2 \omega}{24} \cos((\omega_1 + 2\omega_2) t + (\psi_1 + 2\psi_2)) \\
&+ \frac{a_2 \omega}{96} \cos((\omega_1 - 4\omega_2) t + (\psi_1 - 4\psi_2)) + \frac{a_2 \omega}{96} \cos((\omega_1 + 4\omega_2) t + (\psi_1 + 4\psi_2)) \\
&+ \frac{\epsilon^2}{2\omega_2} f_2 \cos((\omega_2 - \Omega_2) t + \psi_2) + \frac{\epsilon^2}{2\omega_2} f_2 \cos((\omega_2 + \Omega_2) t + \psi_2) \\
&- \frac{2a_2 \epsilon^2}{4\omega_2} f_2 \cos((\omega_2 - \omega_2 - \Omega_2) t + (\psi_1 - \psi_2)) - \frac{2a_2 \epsilon^2}{4\omega_2} f_2 \cos((\omega_2 - \omega_2 + \Omega_2) t + (\psi_1 - \psi_2)) \\
&- \frac{2a_2 \epsilon^2}{4\omega_2} f_2 \cos((\omega_2 + \omega_2 - \Omega_2) t + (\psi_1 + \psi_2)) - \frac{2a_2 \epsilon^2}{4\omega_2} f_2 \cos((\omega_2 + \omega_2 + \Omega_2) t + (\psi_1 + \psi_2)) \\
&+ \frac{\epsilon^2 \Omega_2}{2\omega_2} \cos(\omega_2 t + \psi_2) + \frac{\epsilon^2 \Omega_2}{2\omega_2} \cos((\omega_2 - 2\omega_4) t + (\psi_2 - 2\psi_4)) \\
&+ \frac{\epsilon^2 \Omega_2}{4\omega_2} \cos((\omega_2 + 2\omega_4) t + (\psi_2 + 2\psi_4)) - \frac{\epsilon^2 \Omega_2}{2\omega_2} \cos((\omega_2 - \omega_2) t + (\psi_1 - \psi_2)) \\
&- \frac{\epsilon^2 \Omega_2}{2\omega_2} \cos((\omega_2 + \omega_2) t + (\psi_1 + \psi_2)) - \frac{\epsilon^2 \Omega_2}{2\omega_2} \cos((\omega_2 - (2\omega_2) t + \psi_1 - (\psi_2 - 2\psi_4)) \\
&- \frac{\epsilon^2 \Omega_2}{4\omega_2} \cos((\omega_2 - (2\omega_2) t + \psi_1 + (\psi_2 - 2\psi_4)) \\
&- \frac{\epsilon^2 \Omega_2}{4\omega_2} \cos((\omega_2 + (2\omega_2) t + \psi_1 + (\psi_2 - 2\psi_4)) \\
&- \frac{\epsilon^2 \Omega_2}{4\omega_2} \cos((\omega_2 + (2\omega_4) t + \psi_1 + (\psi_2 + 2\psi_4)) \\
&- \frac{\epsilon^2 \Omega_2}{4\omega_2} \cos((\omega_2 + (2\omega_2) t + \psi_1 + (\psi_2 + 2\psi_4)) \\n\end{align*}
}\]
\[ \dot{\alpha}_3 = -\varepsilon \mu \alpha_3 + \varepsilon \mu \alpha_3 \cos(2\omega_t + 2\psi_3) + \frac{\varepsilon \lambda \alpha_3 \alpha_1}{4\omega_3} \sin((2\omega_3 + \omega_1)t + (2\psi_3 + \psi_1)) \\
\quad + \frac{\varepsilon \lambda \alpha_3 \alpha_1}{4\omega_3} \sin((2\omega_3 - \omega_1)t + (2\psi_3 - \psi_1)) \] (12a)

\[ a_3 \psi_3 = -\varepsilon \mu \alpha_3 \sin(2\omega_t + 2\psi_3) - \frac{\varepsilon \lambda \alpha_3 \alpha_1}{2\omega_3} \cos(\omega_t + \psi_1) \\
\quad - \frac{\varepsilon \lambda \alpha_3 \alpha_1}{4\omega_3} \cos((\omega_1 - 2\omega_3)t + (\psi_1 - 2\psi_3)) - \frac{\varepsilon \lambda \alpha_3 \alpha_1}{4\omega_3} \cos((\omega_1 + 2\omega_3)t + (\psi_1 + 2\psi_3)) \] (12b)

\[ \dot{\alpha}_4 = -\varepsilon \mu \alpha_4 + \varepsilon \mu \alpha_4 \cos(2\omega_t + 2\psi_4) - \frac{\varepsilon \lambda \alpha_4 \alpha_3}{4\omega_4} \sin((2\omega_4 + \omega_2)t + (2\psi_4 + \psi_2)) \\
\quad - \frac{\varepsilon \lambda \alpha_4 \alpha_3}{4\omega_4} \sin((2\omega_4 - \omega_2)t + (2\psi_4 - \psi_2)) \] (13a)

\[ a_4 \psi_4 = -\varepsilon \mu \alpha_4 \sin(2\omega_t + 2\psi_4) - \frac{\varepsilon \lambda \alpha_4 \alpha_3}{2\omega_4} \cos(\omega_t + \psi_2) \\
\quad - \frac{\varepsilon \lambda \alpha_4 \alpha_3}{2\omega_4} \cos((\omega_2 - 2\omega_4)t + (\psi_2 - 2\psi_4)) - \frac{\varepsilon \lambda \alpha_4 \alpha_3}{2\omega_4} \cos((\omega_2 + 2\omega_4)t + (\psi_2 + 2\psi_4)) \] (13b)

We can get the averaging equations conforming to simultaneous primary and internal 1:2 resonance by presenting the detuning parameters \((\sigma, \sigma, \sigma, \sigma)\) according to \(\Omega = \omega_3 = \omega_3, \Omega_4 = \omega_3 = \omega_3, \omega_3 = \frac{1}{2} \omega_3 + \omega_3, \omega_3 = \frac{1}{2} \omega_3 + \omega_3, \) keeping only the constant terms and slowly changing parts in equations (10a) – (13b). So, we’ll have

\[ \dot{\alpha}_1 = -\frac{\varepsilon^2}{2\omega_1} f_1 \sin \theta_1 - \frac{\varepsilon \gamma \alpha_1^2}{4\omega_1} \sin(\theta_1) - \varepsilon \sigma_1 \alpha_1 \] (14a)

\[ a_1 \psi_1 = \frac{3\varepsilon \alpha_1^2}{8\omega_1} - \frac{\varepsilon \alpha_1^2 \alpha_3^2}{4\omega_1} - \frac{\varepsilon^2}{2\omega_1} f_1 \cos \theta_1 + \frac{\varepsilon \gamma \alpha_1^2}{4\omega_1} \cos(\theta_1) \] (14b)

\[ \dot{\alpha}_2 = \frac{\varepsilon^2}{2\omega_2} f_2 \sin \theta_2 - \frac{\varepsilon \gamma \alpha_2^2}{4\omega_2} \sin(\theta_2) - \varepsilon \sigma_2 \alpha_2 \] (15a)

\[ a_2 \psi_2 = \frac{-3\varepsilon \alpha_2^2}{48} - \frac{\varepsilon^2}{2\omega_2} f_2 \cos \theta_2 + \frac{\varepsilon \gamma \alpha_2^2}{4\omega_2} \cos(\theta_2) \] (15b)

\[ \dot{\alpha}_3 = -\varepsilon \mu \alpha_3 - \frac{\varepsilon \lambda \alpha_3 \alpha_1}{2\omega_1 + 4\varepsilon \sigma_3} \sin(\theta_1) \] (16a)
\[ a_3 \dot{\psi}_3 = -\frac{\varepsilon \lambda_1 a_1 a_4}{2\omega_1 + 4\varepsilon \sigma_1} \cos(\theta_3) \] (16b)

\[ \dot{a}_4 = -\varepsilon \mu_4 a_4 + \frac{\varepsilon \lambda_1 a_3 a_4}{2\omega_2 + 4\varepsilon \sigma_4} \sin(\theta_4) \] (17a)

\[ a_4 \dot{\psi}_4 = -\frac{\varepsilon \lambda_1 a_3 a_4}{2\omega_2 + 4\varepsilon \sigma_4} \cos(\theta_4) \] (17b)

Where \( \theta_1 = \psi_1 - \sigma_1 T, \theta_2 = \psi_2 - \sigma_2 T, \theta_3 = \psi_1 - 2\sigma_1 T_1 - 2\psi_3, \theta_4 = \psi_2 - 2\sigma_2 T_1 - 2\psi_4 \)

### 4 Stability Analysis

The stability for this system in equations (1)–(4) is checked at our selective case of resonance coincides to the invariant points of equations (14a)–(17b), that will be gotten by putting \( \dot{a}_n = \dot{\theta}_n = 0 \).

That is,

\[ 0 = -\frac{\varepsilon^2}{2\omega_1} f_1 \sin \theta_1 - \frac{\varepsilon \gamma_1 a_1^2}{4\omega_1} \sin(\theta_1) - \varepsilon \epsilon_1 a_1 \] (18a)

\[ a_1 \sigma_1 = \left( \frac{3\varepsilon \sigma_1 a_1^3}{8\omega_1} - \frac{a_1 a_2^2 \omega_1}{4\omega_1} \right) - \frac{\varepsilon^2}{2\omega_1} f_1 \cos \theta_1 + \frac{\varepsilon \gamma_1 a_1^2}{4\omega_1} \cos(\theta_1) \] (18b)

\[ 0 = \frac{\varepsilon^2}{2\omega_2} f_2 \sin \theta_2 - \frac{\varepsilon \gamma_2 a_2^2}{4\omega_2} \sin(\theta_2) - \varepsilon \epsilon_2 a_2 \] (19a)

\[ a_2 \sigma_2 = \frac{-3\omega_2 a_2^3}{48} - \frac{\varepsilon^2}{2\omega_2} f_2 \cos \theta_2 + \frac{\varepsilon \gamma_2 a_2^2}{4\omega_2} \cos(\theta_2) \] (19b)

\[ 0 = -\varepsilon \mu_3 a_3 - \frac{\varepsilon \lambda_1 a_3 a_4}{2\omega_1 + 4\varepsilon \sigma_3} \sin(\theta_3) \] (20a)

\[ a_3 \sigma_3 = \frac{1}{2} a_3 \sigma_1 + \frac{\varepsilon \lambda_1 a_3 a_4}{2\omega_2 + 4\varepsilon \sigma_3} \cos(\theta_3) \] (20b)

\[ 0 = -\varepsilon \mu_4 a_4 + \frac{\varepsilon \lambda_1 a_3 a_4}{2\omega_2 + 4\varepsilon \sigma_4} \sin(\theta_4) \] (21a)
\[ a_i \sigma_i = \frac{1}{2} a_i \sigma_2 + \frac{\varepsilon \lambda_i a_i}{2\omega_i + 4\varepsilon\sigma_i} \cos(\theta_i) \]  

(21b)

From Eqs (20a) to (21b) we get:

\[ \sin(\theta_i) = \frac{4 \mu_i \omega_i}{\lambda_i a_i} \]  

(22a)

\[ \cos(\theta_i) = \frac{4 \omega_i \left( \sigma_i - \frac{1}{2} \sigma_2 \right)}{\varepsilon \lambda_i a_i} \]  

(22b)

\[ \sin(\theta_i) = \frac{4 \mu_i \omega_i}{\lambda_i a_i} \]  

(23a)

\[ \cos(\theta_i) = \frac{4 \omega_i \left( \sigma_i - \frac{1}{2} \sigma_2 \right)}{\varepsilon \lambda_i a_i} \]  

(23b)

For the practical case, \( a_n \neq 0 \), substituting by equations (22a) to (23b) and squaring equations (18a), (18b), then taking the squared results in a computation process, likewise equations (19a), (19b), equations (20a), (20b) and equations (21a), (21b) deduce the following frequency response equations:

\[ \frac{\varepsilon^4}{4\omega_i^2} f_i^2 = \varepsilon^2 c_i a_i^2 + \frac{\varepsilon^2 c_i \gamma_i a_i^4}{16\omega_i^2} + \left( -a_i \sigma_i + \frac{3\varepsilon \alpha_i a_i^3 - 2a_i a_i \omega_i^2}{8\omega_i} \right)^2 + \frac{\varepsilon^2 c_i a_i \gamma_i a_i^2}{2\omega_i} \sin(\theta_i) \]  

\[ + \frac{\varepsilon^2 c_i \gamma_i a_i^2}{2\omega_i} \left( -a_i \sigma_i + \frac{3\varepsilon \alpha_i a_i^3 - 2a_i a_i \omega_i^2}{8\omega_i} \right) \cos(\theta_i) \]  

(24a)

\[ \frac{\varepsilon^4}{4\omega_i^2} f_i^2 = \frac{\varepsilon^2 \gamma_i^2 a_i^4}{16\omega_i^2} + \varepsilon^2 c_i a_i^2 + \left( -a_i \sigma_i - \frac{3\varepsilon \omega_i}{48} \right)^2 + \frac{\varepsilon^2 c_i a_i \gamma_i a_i^2}{2\omega_i} \sin(\theta_i) \]  

\[ + \frac{\varepsilon^2 c_i \gamma_i a_i^2}{2\omega_i} \left( -a_i \sigma_i - \frac{3\varepsilon \omega_i}{48} \right) \cos(\theta_i) \]  

(24b)

\[ \left( \frac{\varepsilon \lambda_i a_i}{2\omega_i + 4\varepsilon\sigma_i} \right)^2 = \varepsilon^2 \mu_i^2 + \left( \sigma_i - \frac{1}{2} \sigma_2 \right)^2 \]  

(24c)

\[ \left( \frac{\varepsilon \lambda_i a_i}{2\omega_i + 4\varepsilon\sigma_i} \right)^2 = \varepsilon^2 \mu_i^2 + \left( \sigma_i - \frac{1}{2} \sigma_2 \right)^2 \]  

(24d)
5 Nonlinear Solution

The stability for this system was specified by examining the eigenvalues of the right-hand sides of equations (14a) – (17b) which represent as the Jacobian matrix. The equipoise solution is approximately stable as long as the corresponding eigenvalue’s real part is negative. If not, the corresponding result is unstable. To deduce the stability criteria, we just need to check the demeanor of insignificant perturbations from the stabilised-case solutions $\mathbf{a}_{0n}$ and $\mathbf{\theta}_{0n}$.

So, we suppose the following:

\[
\mathbf{a}_n = \mathbf{a}_{0n} + \mathbf{a}_{1n}, \quad \mathbf{\theta}_n = \mathbf{\theta}_{0n} + \mathbf{\theta}_{1n},
\]

\[
\mathbf{\dot{a}}_n = \mathbf{\dot{a}}_{1n}, \quad \mathbf{\dot{\theta}}_n = \mathbf{\dot{\theta}}_{1n}.
\]

(25)

Where $\mathbf{a}_{0n}, \mathbf{\theta}_{0n}$ are the solutions of equations (14a) – (17b) and $\mathbf{a}_{1n}, \mathbf{\theta}_{1n}$ are known as perturbations which are presumed to be very small compared with $\mathbf{a}_{0n}, \mathbf{\theta}_{0n}$. Replacing equation (25) into equations (14a) – (17b) and conserving the linear expressions in $\mathbf{a}_{1n}, \mathbf{\theta}_{1n}$ only. We obtain:

\[
\mathbf{\dot{a}}_{11} = -\varepsilon \mathbf{e}_1 \mathbf{a}_{11} - \frac{\varepsilon^2}{2\omega_1} f_1(\cos \mathbf{\theta}_{10}) \mathbf{\dot{a}}_{11} - \frac{\varepsilon^2}{4\omega_1} (2\mathbf{a}_{10}) (\sin \mathbf{\theta}_{10})\mathbf{a}_{11} - \frac{\varepsilon^2}{4\omega_1} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{11}
\]

(26a)

\[
\mathbf{\dot{a}}_{12} = \left( -\frac{\varepsilon^2}{2\omega_2} - \frac{9\varepsilon \mathbf{a}_{10}}{8\omega_1} - \frac{\varepsilon^2}{4\omega_1} \mathbf{a}_{10} \mathbf{a}_{10} \mathbf{a}_{10} \right) \mathbf{a}_{12} - \frac{\varepsilon^2}{2\omega_1} f_1(\sin \mathbf{\theta}_{10}) \mathbf{a}_{12} - \frac{\varepsilon^2}{2\omega_1} (2\mathbf{a}_{10}) (\sin \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{12}
\]

(26b)

\[
\mathbf{\dot{a}}_{13} = \frac{\varepsilon \mathbf{e}_3 \mathbf{a}_{13}}{4\omega_3} \sin \mathbf{\theta}_{10} \mathbf{a}_{11} + \left( -\varepsilon \mathbf{\mu}_1 + \frac{\varepsilon \mathbf{e}_3 \mathbf{a}_{13}}{4\omega_3} \sin \mathbf{\theta}_{10} \right) \mathbf{a}_{13} + \frac{\varepsilon \mathbf{e}_3 \mathbf{a}_{13}}{4\omega_3} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{13}
\]

(27a)

\[
\mathbf{\dot{a}}_{14} = \frac{\varepsilon \mathbf{e}_4 \mathbf{a}_{14}}{4\omega_4} (\sin \mathbf{\theta}_{10})\mathbf{a}_{13} + \left( -\varepsilon \mathbf{\mu}_2 + \frac{\varepsilon \mathbf{e}_4 \mathbf{a}_{14}}{4\omega_4} \sin \mathbf{\theta}_{10} \right) \mathbf{a}_{14} + \frac{\varepsilon \mathbf{e}_4 \mathbf{a}_{14}}{4\omega_4} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{14}
\]

(27b)

\[
\mathbf{\dot{a}}_{15} = \frac{\varepsilon \mathbf{e}_5 \mathbf{a}_{15}}{4\omega_5} \sin \mathbf{\theta}_{10} \mathbf{a}_{11} + \left( -\varepsilon \mathbf{\mu}_3 + \frac{\varepsilon \mathbf{e}_5 \mathbf{a}_{15}}{4\omega_5} \sin \mathbf{\theta}_{10} \right) \mathbf{a}_{15} + \frac{\varepsilon \mathbf{e}_5 \mathbf{a}_{15}}{4\omega_5} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{15}
\]

(28a)

\[
\mathbf{\dot{a}}_{16} = \frac{\varepsilon \mathbf{e}_6 \mathbf{a}_{16}}{4\omega_6} (\sin \mathbf{\theta}_{10})\mathbf{a}_{13} + \left( -\varepsilon \mathbf{\mu}_4 + \frac{\varepsilon \mathbf{e}_6 \mathbf{a}_{16}}{4\omega_6} \sin \mathbf{\theta}_{10} \right) \mathbf{a}_{16} + \frac{\varepsilon \mathbf{e}_6 \mathbf{a}_{16}}{4\omega_6} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{16}
\]

(28b)

\[
\mathbf{\dot{\theta}}_{11} = \frac{\varepsilon \mathbf{e}_1 \mathbf{a}_{11}}{4\omega_1} - \frac{\varepsilon^2}{2\omega_1} f_1(\cos \mathbf{\theta}_{10}) \mathbf{a}_{11} - \frac{\varepsilon^2}{4\omega_1} (2\mathbf{a}_{10}) (\sin \mathbf{\theta}_{10})\mathbf{a}_{11} - \frac{\varepsilon^2}{4\omega_1} (\cos \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{11}
\]

(29a)

\[
\mathbf{\dot{\theta}}_{12} = \left( -\frac{\varepsilon^2}{2\omega_2} - \frac{9\varepsilon \mathbf{a}_{10}}{8\omega_1} - \frac{\varepsilon^2}{4\omega_1} \mathbf{a}_{10} \mathbf{a}_{10} \mathbf{a}_{10} \right) \mathbf{a}_{12} - \frac{\varepsilon^2}{2\omega_1} f_1(\sin \mathbf{\theta}_{10}) \mathbf{a}_{12} - \frac{\varepsilon^2}{2\omega_1} (2\mathbf{a}_{10}) (\sin \mathbf{\theta}_{10})\mathbf{\dot{\theta}}_{12}
\]

(29b)
The previous equations could be presented in the matrix form:

$$\begin{bmatrix}
\dot{a}_1 & \dot{a}_2 & \dot{a}_3 & \dot{a}_4 & \dot{a}_5 & \dot{a}_6 & \dot{a}_7 & \dot{a}_8 \\
\end{bmatrix}^T = [J][a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8]^T \tag{30}
$$

Where $[J]$ is the Jacobin of the right hand sides of equations (26a) – (29b). Now let us put the eigenvalues of the above system of equations $[J]$ in the following form:

$$\xi^8 + S_1 \xi^7 + S_2 \xi^6 + S_3 \xi^5 + S_4 \xi^4 + S_5 \xi^3 + S_6 \xi^2 + S_7 \xi + S_8 = 0 \tag{31}
$$

If and only if the real part of the eigenvalue, which obtained from Eigen equation (31), is negative, then the solution is stable; otherwise, the solution is going to be unstable. The necessary and sufficient conditions for all the roots of Eq. (31) will be calculated corresponding to the Routh-Hurwitz criterion.

$$D = \begin{bmatrix}
S_1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\
S_3 & S_2 & S_1 & 1 & 0 & 0 & 0 \\
S_4 & S_3 & S_2 & S_1 & 1 & 0 & 0 \\
S_5 & S_4 & S_3 & S_2 & S_1 & 1 & 0 \\
S_6 & S_5 & S_4 & S_3 & S_2 & S_1 & 1 \\
0 & S_6 & S_5 & S_4 & S_3 & S_2 & S_1 \\
0 & 0 & S_6 & S_5 & S_4 & S_3 & S_2 \\
0 & 0 & 0 & S_6 & S_5 & S_4 & S_3 \\
0 & 0 & 0 & 0 & S_6 & S_5 & S_4
\end{bmatrix} \tag{32}
$$

6 Numerical Solutions

The basic system with NSC controllers which expressed in the differential equations form (1-4) was solved by applying Rung–Kutta 4th order method numerically. The emulation results are attained by utilising MATLAB 7.14 (R2013a).

7 Conclusions

The NSC controllers for suppressing of the oscillations of the non-linear spring pendulum have been studied. We represent the problem by non-linear ordinary differential equation system with four-degree-of-freedom. The averaging method is used for the mathematical analysis. For the case of primary resonance in the presence of 1:2 internal resonances, the frequency response equations have been derived. The system’s stability has been discussed by applying the frequency response equations and the phase plane technique. It is worth to notice that the steady-state amplitudes of the spring pendulum with NSC controllers were reduced to about 97.8% in both directions ($X$, $\varphi$) from its value without NSC controllers.

The influences of the diversified parameters of the system are surveyed numerically. This survey makes the frequency response curve with the detuning parameter ($\sigma_1$) is clear due to different parameters. And it was noticed that:

- The amplitude of the system was increasing when the value of $f_1$ increased.
- While the values of $c_1, \omega_1, \gamma_1$ and $\mu_1$ were increasing, the values of the amplitude of the system decreased.

Also, we studied the effectiveness of distinguished parameters on the frequency response curve with the detuning parameter ($\sigma_2$). The most obviousness features are:

- The amplitude of the system was direct proportional to the values of $f_2$.
- The amplitude of the system was inverse proportional to the values of the following parameters $c_2, \omega_2, \gamma_2, \lambda_2$ and $\mu_2$. 

---

Amer et al.; ARJOM, 11(1): 1-22, 2018; Article no.ARJOM.44589
The effectiveness of the controller $E_a$ (steady-state amplitudes of the system without controller/steady-state amplitudes with controller) is about 45.3 for ($X$) and 40.5 for ($\Phi$).
